## Global navigation satellite system, GNSS: EC agreement, Eurocontrol and the European space agency

OBJECTIVE: the proposal for a Council Decision approves the Agreement between the European Community, the European Space Agency and the European Organization for the Safety of Air Navigation on a European contribution to the development of a Global Navigation Satellite System (GNSS). SUBSTANCE: the basic objective of the Agreement is to establish a focal point for all activities pertaining to satellite navigation and positioning in Europe. It would allow a European contribution to the development of a worldwide multimodal satellite navigation system. In a situation of potential US dominance of the satellite navigation market, the Agreement will help to protect European interests and facilitate the realization of the full potential of satellite-based technology for navigation. It will also facilitate the negotiation of international agreements at political and technical level to ensure interoperability of regional contributions to the system. The Agreement also provides for a coordinating mechanism to ensure the convergence of the various efforts required to meet the overall objectives for development of the system. ?

## Global navigation satellite system, GNSS: EC agreement, Eurocontrol and the European space agency

The Committee has unanimously adopted the report by Brigitte LANGENHAGEN (EPP, D) on the Commission proposal for the development of a Global Navigation Satellite System (GNSS). The European Community, the European Space Agency and the European Organisation for the Safety of Air Navigation aim to work on a European contribution towards the development of such a GNSS. In particular, projects and plans will be brought together and be coordinated. European industry will play an important role in the realisation of the project. The existing Satellite Navigation System is a communication system which enables the geographical positioning and navigation of any mode of transport. Although it is mainly used to improve air transport efficiency and reduce costs of ground-based control, its use has significantly expanded in the recent years to include land transport vehicles and ships. The increase in civilian use of satellites creates a big demand on the 24 military satellites which are actually in geostationary orbit and are mainly owned by American and Russian military services. Their availability for civilian use is being restricted, as the services offered can be suspended or interrupted to give precedence to military applications. Rapporteur LANGENHAGEN said that, in future, the EU will be in a position to allow provision for a satellite navigation service which will satisfy the requirements of civil users and that a GNSS will undoubtedly promote the more efficient use of actual transport capacity. In a world where traffic congestion of all modes of transport is steadily increasing, this aid to improving transport flow should fully be supported.?

## Global navigation satellite system, GNSS: EC agreement, Eurocontrol and the European space agency

---

In adopting the report by Mrs Brigitte LANGENHAGEN (EPP, D), Parliament approved the conclusion of the agreement on a European contribution to the development of a global navigation satellite system. Parliament considered that the Union should continue to be able to provide a satellite navigation service which met the operational requirements of civilian users and that the GNSS would encourage a more profitable use of current transport capacities. ?

## Global navigation satellite system, GNSS: EC agreement, Eurocontrol and the European space agency

---

OBJECTIVE: Approval of the Agreement between the European Community, the European Space Agency and the European Organisation for the Safety of Air Navigation on a European contribution to the development of a global navigation satellite system (GNSS). COMMUNITY MEASURE: Council Decision 98/434/EC. SUBSTANCE: The object of the agreement approved on behalf of the Community is to establish cooperation between the parties with a view to making a European contribution to the implementation of a global navigation satellite system. This joint effort aims to enable Europe to provide a satellite navigation service which meets the operational needs of civilian users, independently of other radionavigation and positioning systems. ?
