Integrated maritime policy for the EU

The Commission presented a communication on the conclusions from the consultation on a European maritime policy which followed the adoption of the Green Paper on Maritime Policy.

The consultation lasted one year and received a response that was unprecedented both in terms of the scope and in the depth of the participation in the consultation process. The Commission received over 490 contributions and over 230 events were held where maritime

policy was discussed with stakeholders.

The main conclusions are as follows:

The Search for Added Value: stakeholders are in favour of an integrated approach to Maritime Policy in the European Union, because it integrates the needs and concerns of linked sectors that are currently dealt with in separate policy activities. The consultation process confirms the scope for developing the relationship between those who live and work in day-to-day contact with the seas, including seafarers and fishermen, as well as other related sectors of economic activity. Operators point out the need for the integration of systems and standards in the area of maritime monitoring and surveillance. Researchers point to the economic benefits of the combined use of expensive assets for their work.

Certain stakeholders urge that the development of an integrated approach should not lead the EU to re- or over-regulate, or to over-centralise. A significant number do not want to see an integrated policy change existing competences.

Subsidiarity means Responsibility: The response to the Green Paper confirms that a European Maritime Policy must build on the existing distribution of competences within the EU. The subsidiarity principle and the involvement of stakeholders will play a key role in the future initiatives taken in the area of the EU?s maritime policy.

The European Union's role is seen as facilitator rather than integrator per se. This is particularly the case as far as spatial planning and offshore government activities are concerned. There is little support for a European Coast Guard, but there is interest in cooperation between Member States' assets to achieve similar objectives without changing competences.

Much emphasis has been placed on the necessity that existing policies and legal frameworks are better implemented and interact in a more consistent way. Calls were made in favour of specific regulatory initiatives in order to close gaps in EU legislation. The broad participation of local and regional government bodies indicates an enthusiasm to learn from others, share experience and contribute ideas. Industry, on the other hand, calls for less regulation and more self-regulation.

Global Issues and Responsibilities: the global nature of maritime activities, such as shipping and fisheries, became apparent in the course of the consultation. Several stakeholders thought that the EU should promote measures to protect the global ecosystem, including on the high seas.

Here, the majority of stakeholders agree on the need for multilateral rules and standards and their implementation and enforcement. Views on how to achieve this differ; some insist on developing standards only in the multilateral context, and are opposed to the EU developing standards first. However, a significant number of stakeholders believe that the EU has an important role to play in leading by example.

The consultation process thus confirms the importance of developing an international dimension to a European Maritime Policy. Stakeholders want to ensure that the current system is used to its fullest extent before trying out new solutions.

Sustainable Use of Resources: the consultation process highlights how much Europe's prosperity relies on the availability of safe and efficient shipping services. Stakeholders agree that European shipping services and ports are sectors with high growth potential and that the EU's international and internal performance in the maritime sectors is built on delivering higher quality ? not in being cheaper. The technologies of the future will be crucial building blocks for a more sustainable economy, e.g. the development of renewable energy, in particular wind and wave energy.

The consultation process has revealed strong support for the better collection and use of (real-time and other) data on oceans and seas. There is a need for high standards to ensure high quality and thus competitiveness, and standards that support sustainability. Industry points out that competitiveness on the basis of high standards will only work if these standards are applied across the board, securing a level playing field. They also point out that voluntary approaches may sometimes bring better results than prescriptive regulation.

Stakeholders indicate that there is scope for improvement in skills and training. There are divergences on whether, and which, exclusions concerning maritime sectors in EU social legislation are justified, but there is agreement on the need to contribute to a global level playing field for the sector and the role that EU legislation can play in this context.

There is very little dispute about the need to set up marine protected areas ? but there is discussion about their designation. The development of blue biotechnology or other uses of genetic resources is seen as an opportunity, demonstrating the need for an integrated approach linking research, sustainability, and international rule-making. Stakeholders point out that up to 80% of the pollution of the marine environment is land-based and call for more action on this.

The importance of linkages between existing environmental instruments and the implementation of the marine thematic strategy is mentioned. Coherence and compatibility are underscored as essential for the implementation of all these instruments. Some stakeholders highlight the need to go beyond the Marine Thematic Strategy to embrace broader environment protection objectives, while others want to ensure that the impacts of environmental measures and legislation take economic priorities duly into account.

Working on the basis of ecosystems and eco-regions is fundamental for the sustainable management of sea and coastal spaces. Stakeholders point to the need for cooperation between coastal regions and neighbouring Member States ? as well as neighbouring countries. There are many voices calling for a stronger integration of environmental concerns within fisheries combined with stronger integration of fisheries within maritime policy. Lastly, according to stakeholders, without improvements in training, working conditions and job opportunities for fishermen, developing a sustainable approach to fisheries is not realistic.

Maritime Management: stakeholders emphasise the need for coordinated management and planning for competing uses of the seas. They agree that maritime spatial planning would be a good tool to apply across the EU, but should remain a Member State competence.

The initiative to develop a European Data Network is generally welcomed, and many proposals are made as to practical ways and means of taking on this task. Very few stakeholders dispute the potential to achieve cost savings through standardisation, interlinking and communication between existing sectoral systems.

Regional stakeholders, including the Committee of the Regions, call, for the adoption of specific and targeted approaches to funding in coastal regions, through more transparency, and the linking of existing financial tools, under the umbrella of a European Coastal Fund.

Europeans and the Sea: Participation and Involvement: contributions call for consultation and dialogue, and for more information to be made available to all affected by maritime policy.

Individual citizens and civil society respond with mixed messages. There is some concern that the EU should not take over national or local competences but overall the reactions indicate of the public's concern for the planet's marine ecosystem and their impression that insufficient government action is being taken against practices that damage it.

There is a general consensus that the overallimage of the maritime sectors needs to be enhanced. Ideas abound for theorganisation of exchanges of best practice, conferences, the involvement of expertsin the maritime world, such as fishermen, or small-scale projects aimed at informinglocal communities or tourists.

Integrated maritime policy for the EU

PURPOSE: to set out an ?Integrated Maritime Policy? for the EU.

CONTENT: Europe?s maritime spaces and its coasts are central to its well-being and prosperity ? they are Europe?s trade routes, climate regulator, source of food, energy and resources, and a favoured site for recreational and residence purposes. Yet the strain is showing and Europe stands at a cross-roads. The accumulated effect of over-activity in the maritime spaces is leading to conflicts of use and to a deterioration in the marine environment. In the face of rapid globalisation and climate change the need for Europe to address these challenges is great.

In a bid to address these challenges the Commission held a series of consultation exercises on how Europe relates to the sea. Based on the results of this exercise the Commission, in this report, sets out its vision of an ?Integrated Maritime Policy? for the EU. This policy is based on the assumption that all matters relating to Europe?s oceans and seas are interlinked and that sea-related policies must be developed in order to reap the desired results.

The integrated policy will:

- Alter the way policies are adopted and decisions are made. This requires the development of common tools and the identification of synergies
- Develop and deliver a programme of work. This will require the differing sectoral polices to develop in a coherent policy framework.

The report lays down a foundation for the governance framework and the cross-sectoral tools needed for an effective Maritime Policy. It also sets out the main actions that the Commission will pursue during the course of this mandate. These actions will be guided by the principles of subsidiarity and competitiveness, the ecosystem approach and stakeholder participation.

As far as the governance framework for a maritime policy is concerned, the application of an integrated approach to Maritime governance (for example, better regulation) is analysed; and the kind of tools needed to deliver an integrated policy-making is set out. Tools that include a European network for maritime surveillance; maritime spatial planning an integrated coastal zone management system (ICZM); and data information.

In terms of the kind of actions that will be undertaken in order to implement the policy, this paper proposes:

- Maximising the sustainable use of the oceans and seas: The policy?s first goal will be to create optimal conditions for the sustainable use of the oceans and seas. This approach requires a new strategic vision for the development of shipping; the use of European sea ports, shipbuilding, repair and marine equipment industries, maritime jobs and the quality of the marine environment.
- Building a knowledge and innovation base for the maritime policy: Marine science, technology and research are crucial for the sustainable development of sea-based activities. The development of the Marine Observation and Data Network is an important tool for this strategy.
- Deliver a high standard and qualify of living in coastal regions: Population growth in coastal regions and islands has been double the EU average over the last decade. The coastal regions also absorb large numbers of European tourists. Regional authorities and coastal communities have an important role to play in the regulation of coastal and maritime activities. The Committee of the Regions, coastal regions and their networks are thus key partners in the development of an EU Integrated Maritime Policy.
- Promote Europe?s leadership in International Maritime Affairs: The EU will work towards a more efficient international governance of maritime affairs and effective enforcement of international maritime law. It will urge the Member States to ratify any relevant instruments and will promote the coordination of European interests in key international fora.
- Raise Europe?s maritime visibility. The integrated Maritime policy will seek to raise the visibility of a Maritime Europe and improve the image of maritime activities and the seafaring professions. It will also seek to promote Europe?s maritime heritage, support maritime communities, support traditional skills and promote links between the various maritime communities.

To conclude this Communication, the Commission notes that an integrated maritime policy has the support of the Council which invited the Commission to present an Action Plan. Through this Communication and Action Plan the Commission has responded to this request whilst taking account of the views and opinions expressed by interested parties during the consultation round.

Integrated maritime policy for the EU

The Committee on Transport and Tourism adopted the own-initiative report by Willi PIECYK (PES, DE) on an integrated maritime policy for the European Union, in response to a communication on this subject.

While welcoming the Commission?s communication, MEPs believe that, on the whole, the Action Plan includes too few practical measures. The Commission is called to be more ambitious in future in using the instruments at its disposal under the Treaties. MEPs also regret the fact that the Action Plan addresses the challenges of climate change only in a non-binding way: in their opinion, one task of the European maritime policy has to be to lay down, as a matter of urgency, the adjustment measures required, especially in view of the melting of glaciers leading to the rise in sea levels, together with the increased risk of flooding of ports and coastal regions. In this respect, they call for all relevant policies, and research policy in particular, to play their part.

The parliamentary committee reaffirms its call for maritime policy to make a substantial contribution to reducing greenhouse gas emissions, in particular by incorporating shipping into emissions trading and enhancing research efforts both with regard to exploiting the seas as a source of renewable energy and with a view to developing new, cleaner ship propulsion technologies. It calls emphatically on the Commission to be more ambitious in combating sulphur and nitrogen oxide emissions, as well as solid waste from ships, and to cooperate more closely with the IMO (International Maritime Organisation) on this issue.

MEPs point out that land-based pollution of the seas constitutes a significant proportion of overall maritime pollution in Europe and indicate the absence of a solution to this issue from the Commission. They reiterate their call for the Commission to put forward an action plan to reduce

such pollution, and ask Member States to act promptly to transpose the legislation in this field, such as the water framework directive. They also urge the Commission to help Member States to launch a plan to survey and map wrecked ships and submerged archaeological sites since these form part of the Community?s historic and cultural heritage.

The report welcomes the Commission's stocktaking with regard to the exclusion of seafarers from a number of areas of European social and labour protection rules. MEPs proposethat these directives be revised in close cooperation with the social partners. They urge those Member States which have not yet done so to ratify, as soon as possible, the Maritime Labour Convention, 2006, adopted with a view to improving the living and working conditions of seafarers and to preventing unfair competition in the shipping industry by updating and codifying the entire body of international labour standards in force.

In the fishing sector, the key objective of the maritime policy for the European Union should be to promote the modernisation and sustainable, balanced and fair development of the industry. MEPs believe that creating more and better seafaring jobs, particularly in the fishing industry, also depends on a guarantee of a fair and adequate income, proper working conditions (including health and safety) and access to training for people working in the industry. Member States are called to mutually recognise intermediate diplomas for the occupations of steersman and mechanic for fishing vessels.

The report emphatically supports the Commission's intention to exploit the potential of short sea shipping and inland waterway transportbetween the Member States and to integrate this rapidly into the single market. In addition, it welcomes the Commission?s intention to speed up its proposals for a common maritime transport area together with a comprehensive maritime transport strategy for 2008-2018.

Lastly, MEPs support the proposal to establish an annual 'European Maritime Day', which should be used to highlight the significance of maritime policy outside maritime circles, with the participation of ordinary citizens, schools, universities and non-governmental organisations.

Integrated maritime policy for the EU

The European Parliament adopted by 587 votes to 20, with 38 abstentions, a resolution on an integrated maritime policy for the European Union, in response to the Commission?s communication on the subject.

The own-initiative report had been tabled for consideration in plenary by Willi PIECYK (PES, DE) on behalf of the Committee on Transport and Tourism.

While MEPs welcome the Commission?s communication, they take the overall view that the Action Plan includes too few practical measures. The Commission is invited to be more ambitious in future in using the instruments at its disposal under the Treaties. MEPs regret the fact that the Action Plan addresses the challenges of climate change only in a non-binding way: in their opinion, one task of a European maritime policy has to be to lay down the adjustment measures required, as a matter of urgency, especially in view of the melting of glaciers leading to the rise in sea levels, together with the increased risk of flooding of ports and coastal regions. As a result, they welcome the Commission's intention to put forward an Arctic Initiative and call on the scientific community and decision makers to further explore possibilities for protecting the polar ice caps.

The Resolution recalls that maritime policy must make a substantial contribution to reducing greenhouse gas emissions, notably by incorporating shipping into the emissions trading scheme and enhancing research efforts both with regard to exploiting the seas as a source of renewable energy and with a view to developing cleaner new ship propulsion technologies. It calls emphatically on the Commission to be more ambitious in combating sulphur and nitrogen oxide emissions, as well as solid waste from ships, and to cooperate more closely with the International Maritime Organization (IMO), which particularly concerns:

- introducing nitrogen oxide emission standards for ships using EU ports;
- designating the Mediterranean Sea, the Black Sea and the North-East Atlantic as Sulphur Emission Control Areas (SECAs) under the International Convention for the Prevention of Pollution from Ships (MARPOL Convention);
- reducing the maximum permitted sulphur content in marine fuels used in SECAs by passenger vessels from 1,5 % to 0,5 %;
- introducing fiscal measures, such as taxes or charges on sulphur dioxide and nitrogen oxide emissions from ships and identifying ways of imposing such measures and charges on all ships, regardless of flag, putting into Community ports or sailing within the waters of EU Member States;
- promoting the introduction of differentiated harbour and waterway charges to favour ships with low sulphur dioxide and nitrogen oxide emissions;
- gradually introducing a requirement for ships at ports to use land-based electricity;
- proposing an EU directive on the quality of marine fuels.

MEPs point out that land-based pollution of the seas constitutes a significant proportion of overall maritime pollution and that the Commission has so far not got to grips with this issue. They reiterate their call for the Commission to put forward an action plan to reduce such pollution, and call for the Member States to act promptly to transpose the legislation in this field, such as the water framework Directive, into national law. They also urge the Commission to help Member States to launch a plan to survey and map wrecked ships and submerged archaeological sites ? since these form part of the Community's historic and cultural heritage.

The Resolution welcomes the Commission's stocktaking with regard to the exclusion of seafarers from a number of areas of European social and labour protection rules (e.g. collective redundancies, the safeguarding of employees' rights in the event of transfers of undertakings, the informing, consulting and posting of workers). MEPs propose that these directives be revised in close cooperation with the social partners. They urge those Member States which have not yet done so to ratify, as soon as possible, the Maritime Labour Convention (2006) adopted with a view to improving the living and working conditions of seafarers and to preventing unfair competition in the shipping industry by updating and codifying the entire body of international labour standards in force.

In terms of international piracy, MEPs call upon the Commission and the Member States to actively support, in the framework of the UN and the IMO, the initiative promoted by several Member States, to extend the right of sea and air pursuit to the territorial waters of the coastal states, provided the countries concerned agree, as well as to develop a mechanism of mutual assistance against cases of maritime piracy. The Commission is called to set up a Community system for coordination and mutual assistance, which would allow naval vessels flying the flag of a Member State deployed in international waters, to protect fishing and merchant vessels from other Member States.

In the fishing sector, the key objective of the integrated maritime policy for the European Union should be to promote the modernisation and

sustainable, balanced and fair development of the industry. MEPs are of the opinion that creating more and better seafaring jobs, particularly in the fishing industry, also depends on a guarantee of a fair and adequate income, proper working conditions (including health and safety) and access to training for people working in the industry. Member States are asked to work towards the mutual recognition of intermediate diplomas for the occupations of steersman and mechanic for fishing vessels.

Lastly, MEPs support the proposal to establish an annual 'European Maritime Day', which should be used to highlight the significance of maritime policy outside maritime circles, with the participation of ordinary citizens, schools, universities and non-governmental organisations.
